

## 2.2 counter class

```
program.cs
using System;

using System.Diagnostics.CodeAnalysis;
using System.Diagnostics.Metrics;

namespace counterclass
{
    public class program
    {
        private static void PrintCounter(counter[] counters)//we call the counter.cs into a
        new variable counters
        {
            foreach (counter c in counters)
            {
                //Console.WriteLine(c.Name + " is " +c.Tick);

                Console.WriteLine("{0} is {1}", c.Name, c.Tick); //replace {0},{1} and
                c.Name,c.Tick

            }
        }

        public static void Main(string[] args)
        {
            counter[] myCounters = new counter[3];

            myCounters[0] = new counter("Counter 1"); //first counter display as gievn
            myCounters[1] = new counter("Counter 2"); //second counter display as given
```

```
    myCounters[2] = myCounters[0]; //when myCounters[2] it will call back to  
counter[0]
```

```
    for (int i = 0; i <= 9; i++) //set i till reaches 9 then display next value above the set i  
value
```

```
    {  
        myCounters[0].increment(); //use the increment value from counter.cs to  
increase the i value
```

```
    }  
    for (int i = 0; i <= 14; i++) //set i till reaches 14 then display next value above the set  
i value
```

```
    {  
        myCounters[1].increment(); //use the increment value from counter.cs to  
increase the i value
```

```
    }
```

```
PrintCounter(myCounters); //print the console.WriteLine from the line above
```

```
Console.ReadLine();//read the myCounter input
```

```
myCounters[2].Reset(); //use the reset function from counter.cs
```

```
PrintCounter(myCounters); //print again the PrintCounter
```

```
Console.ReadLine(); //read the myCounter input
```

```
    }  
}
```

```
}
```

```
}
```

```
//printing counter values
```

```
//PrintCounter(myCounters);
```

```
//prints the current state of all counters.
```

```
//Since myCounters[0] and myCounters[2] are the same object,  
//they will have the same Tick value (10). myCounters[1] will  
//have a Tick value of 15.  
  
//PrintCounter(myCounters);  
//prints the current state of all counters.  
//Since myCounters[0] and myCounters[2] are the same object,  
//they will have the same Tick value (10). myCounters[1] will have a Tick value of 15.  
  
//Printing the Counter Values Again:  
//PrintCounter(myCounters); prints the updated state.  
//Now, myCounters[0] and myCounters[2] will show a Tick value of 0,  
//while myCounters[1] remains at 15. Printing the Counter Values Again:
```

```
Counter.cs  
using System;  
  
using System.Collections.Generic;  
using System.ComponentModel.DataAnnotations;  
using System.Linq;  
using System.Text;  
using System.Threading.Tasks;  
  
namespace counterclass  
{  
    public class counter  
    {  
        private int _count;
```

```
private string _name; //declare as private class here
```

```
public counter(string name) //intialize the variable _name and _count set value
```

```
{
```

```
    _name = name;
```

```
    _count = 0;
```

```
}
```

```
public void increment() //this code of line helps to do increment to our counter +1  
per tick
```

```
{
```

```
    _count++; //+1
```

```
}
```

```
public void Reset() //this code meanwhile helps reset the counter to 0
```

```
{
```

```
    _count = 0; //set 0
```

```
}
```

```
public string Name //declare the variable as public class so we are able to call the  
variable
```

```
{
```

```
    get
```

```
{
```

```
    return _name; //call the variable _name to use for set value below
```

```
}
```

```
set
```

```
{
```

```
    _name = value; //transfer the value to our _name
```

```
}
```

```

    }

    public int Tick
    {
        get
        {
            return _count; //per tick is based on our increment in _count++ so now we call
the variable again to be used
        }
    }

}

}

```

Output for the program

The screenshot shows the Microsoft Visual Studio Debug Console window. The title bar reads 'Microsoft Visual Studio Debug Console'. The output text is as follows:

```

Counter 1 is 10
Counter 2 is 15
Counter 1 is 10

Counter 1 is 0
Counter 2 is 15
Counter 1 is 0

C:\Users\User\source\repos\counterclass\countercl
